WHAT IS CLAIMED IS:

1   1.   A network device comprising:

2   an access control list, wherein

3   said access control list comprises an access control list entry, and

4   said access control list entry comprises a user group field.

1   2.   The network device of claim 1, wherein

2   said access control list comprises a plurality of access control list entries, and

3   said access control list entries comprise said access control list entry.

1   3.   The network device of claim 2, wherein said access control list entry

2   further comprises:

3   a flow label field, wherein

4   said flow label field allows said access control list entry to be identified as

5   a role-based access control list (RBACL) entry.

1   4.   The network device of claim 2, wherein said access control list entry

2   further comprises:

3   a plurality of user group fields, wherein

4   said user group fields comprise said user group field.

1   5.   The network device of claim 4, wherein said user group fields further

2   comprise:

3   a source user group field; and

4   a destination user group field.

1   6.   The network device of claim 5, wherein

2   said source user group field stores a source user group identifier, and

3   said source user group identifier identifies a user group of a source of a packet

4   processed using said access control list.

1   7.   The network device of claim 5, wherein

2   said destination user group field stores a destination user group identifier, and

3   said destination user group identifier identifies a user group of a destination of a

4   packet processed using said access control list.

1   8.   A network device comprising:

2   a forwarding table, wherein

3   said forwarding table comprises a plurality of forwarding table entries, and

4   at least one forwarding table entry of said forwarding table entries

5   comprises a user group field.

1   9.   The network device of claim 8, wherein said at least one forwarding table

2   entry further comprises:

3   a port identifier field, wherein

4   a port identifier stored in said port identifier field identifies a port.

1   10.   The network device of claim 9, wherein

2   a user group, identified by a user group identifier stored in said user group field, is

3   associated with said port.

1   11.   The network device of claim 10, wherein said at least one forwarding table

2   entry further comprises:

3   a media access control (MAC) address field configured to store a MAC address;

4   and

5   a virtual local area network (VLAN) identifier field, wherein

6   a VLAN identifier stored in said VLAN identifier field identifies a VLAN,

7   and

8   a combination of said MAC address and said VLAN identifier identify said

9   port and a user group identified by a user group identifier stored in

10   said user group field.

1   12.   The network device of claim 10, wherein said at least one forwarding table

2   entry further comprises:

3   a media access control (MAC) address field configured to store a MAC address,

4   wherein

5   said MAC address is associated with a user group identified by a user

6   group identifier stored in said user group field.

1   13.   The network device of claim 8, wherein said at least one forwarding table

2   entry further comprises:

3   a virtual local area network (VLAN) identifier field, wherein

4   a VLAN identifier stored in said VLAN identifier field identifies a VLAN,

5   and

6   said VLAN is associated with a user group identified by a user group

7   identifier stored in said user group field.

1   ·14.   A method comprising:

2   comparing a user group of a packet with a user group of a destination of said

3   packet.

1   15.   The method of claim 14, wherein

2   said user group of said destination of said packet is identified by a user group

3   identifier, and

4   said user group identifier is stored in a role-based access control list entry of an

5   access control list.

1   16.   The method of claim 14, wherein

2   said user group of said packet is a source user group, and

3   said user group of said destination of said packet is a destination user group.

1	17.	The method of claim 16, wherein
2		said source user group is assigned to a source of said packet based on a role of said
3		source, and
4		said destination user group is assigned to said destination based on a role of said
5		destination.
1	18.	The method of claim 16, further comprising:
2		retrieving said destination user group from a forwarding information base.
1	19.	The method of claim 18, further comprising:
2		storing said destination user group in an access control list.
1	20.	The method of claim 16, wherein
2		said source user group is indicated by a source user group identifier stored in said
3		packet, and
4		said destination user group is indicated by a destination user group stored in a
5		network device receiving said packet.
1	21.	The method of claim 16, further comprising:
2		determining said source user group; and
3		determining said destination user group by looking up said destination user group
4		in an access control list.
1	22.	The method of claim 21, wherein
2		said destination user group is identified by a destination user group identifier, and
3		said destination user group identifier is stored in a role-based access control list
4		entry of said access control list.
1	23.	The method of claim 21, wherein
2		said access control list is a role-based access control list.

1   24.   The method of claim 21, wherein said determining said source user group

2 comprises:

3   extracting a source user group identifier from said packet, wherein

4   said source user group identifier identifies said source user group.

1   25.   The method of claim 24, further comprising:

2   populating said access control list with a destination user group identifier, wherein

3   said destination user group identifier identifies said destination user group.

1   26.   The method of claim 25, wherein

2   said destination user group is assigned to said destination based on a role of said

3   destination.

1   27.   The method of claim 25, wherein

2   said comparing and said populating are performed by a network device, and

3   said populating comprises

4   sending a request to another network device, and

5   receiving a response from said another network device, wherein

6   said response includes a destination user group identifier, and

7   said destination user group identifier identifies said destination user

8   group.

1   28.   The method of claim 14, further comprising:

2   populating a forwarding table with a user group identifier, wherein

3   said user group identifier identifies said user group of said packet, and

4   said user group of said packet indicates a user group of a source of said

5   packet.

1   29.   The method of claim 28, wherein

2   said source user group is assigned to said source based on a role of said source.

1	30. The method of claim 28, wherein
2	said user group is a source user group, and
3	said user group identifier is a source user group identifier.

1	31. The method of claim 30, wherein
2	said comparing and said populating are performed by a network device, and
3	said populating comprises
4	determining said source user group.

1	32. The method of claim 31, wherein said populating further comprises:
2	receiving an authentication message from another network device, wherein
3	said response includes said source user group identifier.

1	33. A computer program product comprising:
2	a first set of instructions, executable on a computer system, configured to compare
3	a user group of a packet with a user group of a destination of said packet;
4	and
5	computer readable media, wherein said computer program product is encoded in
6	said computer readable media.

1	34. The computer program product of claim 33, wherein
2	said user group of said packet is a source user group, and
3	said user group of said destination of said packet is a destination user group.

1	35. The computer program product of claim 34, further comprising:
2	a second set of instructions, executable on said computer system, configured to
3	retrieve said destination user group from a forwarding information base.

1	36. The computer program product of claim 35, further comprising:
2	a third set of instructions, executable on said computer system, configured to
3	storing said destination user group in an access control list.

1   37.   The computer program product of claim 33, wherein

2   said source user group is indicated by a source user group identifier stored in said

3   packet, and

4   said destination user group is indicated by a destination user group stored in a

5   network device receiving said packet.

1   38.   The computer program product of claim 34, further comprising:

2   a second set of instructions, executable on said computer system, configured to

3   determine said source user group; and

4   a third set of instructions, executable on said computer system, configured to

5   determine said destination user group by looking up said destination user

6   group in an access control list.

1   39.   The computer program product of claim 38, wherein said second set of

2   instructions comprises:

3   a first subset of instructions, executable on said computer system, configured to

4   extract a source user group identifier from said packet, wherein

5   said source user group identifier identifies said source user group.

1   40.   The computer program product of claim 39, further comprising:

2   a fourth set of instructions, executable on said computer system, configured to

3   populate said access control list with a destination user group identifier,

4   wherein

5   said destination user group identifier identifies said destination user group.

1   41.   The computer program product of claim 33, further comprising:

2   a second set of instructions, executable on said computer system, configured to

3   populate a forwarding table with a user group identifier, wherein

4   said user group identifier identifies said user group of said packet, and

5   said user group of said packet indicates a user group of a source of said

6   packet.

1   42.   The computer program product of claim 41, wherein said second set of

2 instructions comprises:

3   a first subset of instructions, executable on said computer system, configured to

4   determine said source user group.

1   43.   The computer program product of claim 42, wherein said second set of

2 instructions comprises:

3   a second subset of instructions, executable on said computer system, configured to

4   receive an authentication message from another network device, wherein

5   said response includes said source user group identifier.

1   44.   An apparatus comprising:

2 means for comparing a user group of a packet with a user group of a destination of

3   said packet.

1   45.   The apparatus of claim 44, wherein

2 said user group of said packet is a source user group, and

3 said user group of said destination of said packet is a destination user group.

1   46.   The apparatus of claim 45, further comprising:

2 means for retrieving said destination user group from a forwarding information

3   base.

1   47.   The apparatus of claim 46, further comprising:

2 means for storing said destination user group in an access control list.

1   48.   The apparatus of claim 45, wherein

2 said source user group is indicated by a source user group identifier stored in said

3   packet, and

4 said destination user group is indicated by a destination user group stored in a

5   network device receiving said packet.

1   49.   The apparatus of claim 45, further comprising:

2   means for determining said source user group; and

3   means for determining said destination user group by looking up said destination

4   user group in an access control list.

1   50.   The apparatus of claim 49, wherein said means for determining said source

2 user group comprises:

3   means for extracting a source user group identifier from said packet, wherein

4   said source user group identifier identifies said source user group.

1   51.   The apparatus of claim 50, further comprising:

2   means for populating said access control list with a destination user group

3   identifier, wherein

4   said destination user group identifier identifies said destination user group.

1   52.   The apparatus of claim 44, further comprising:

2   means for populating a forwarding table with a user group identifier, wherein

3   said user group identifier identifies said user group of said packet, and

4   said user group of said packet indicates a user group of a source of said

5   packet.

1   53.   The apparatus of claim 52, wherein

2   said means for comparing and said means for populating are included in a network

3   device, and

4   said means for populating comprises

5   determining said source user group.

1   54.   The apparatus of claim 53, wherein said means for populating further

2 comprises:

3   means for receiving an authentication message from another network device,

4   wherein

5   said response includes said source user group identifier.

1   55.   A method comprising:

2   populating an access control list with a destination user group identifier, wherein

3   said destination user group identifier identifies a destination user group of

4   a destination.

1   56.   The method of claim 55, wherein

2   said destination user group is assigned to said destination based on a role of said

3   destination.

1   57.   The method of claim 55, wherein

2   said populating is performed by a network device and comprises

3   sending a request to another network device, and

4   receiving a response from said another network device, wherein

5   said response includes said destination user group identifier, and

6   said destination user group identifier identifies said destination user

7   group.

1   58.   The method of claim 55, further comprising:

2   comparing a user group of a packet with said destination user group.

1   59.   The method of claim 58, wherein

2   said user group of said packet is a source user group,

3   said destination user group is a user group of a destination of said packet, and

4   said destination is said destination of said packet.

1   60.   The method of claim 59, wherein

2   said source user group is assigned to a source of said packet based on a role of said

3   source, and

4   said destination user group is assigned to said destination based on a role of said

5   destination.

1 61. The method of claim 59, wherein
2 said source user group is indicated by a source user group identifier stored in said
3 packet, and
4 said destination user group is indicated by a destination user group stored in a
5 network device receiving said packet.

1 62. The method of claim 59, further comprising:
2 determining said source user group; and
3 determining said destination user group by looking up said destination user group
4 in an access control list.

1 63. The method of claim 62, wherein
2 said access control list is a role-based access control list.

1 64. The method of claim 62, wherein said determining said source user group
2 comprises:
3 extracting a source user group identifier from said packet, wherein
4 said source user group identifier identifies said source user group.

1 65. A computer program product comprising:
2 a first set of instructions, executable on a computer system, configured to populate
3 an access control list with a destination user group identifier, wherein
4 said destination user group identifier identifies a destination user group of
5 a destination; and
6 computer readable media, wherein said computer program product is encoded in
7 said computer readable media.

1 66. The computer program product of claim 65, further comprising:
2 a second set of instructions, executable on said computer system, configured to
3 compare a user group of a packet with said destination user group.

1   67.   The computer program product of claim 66, wherein

2   said user group of said packet is a source user group,

3   said destination user group is a user group of a destination of said packet, and

4   said destination is said destination of said packet.

1   68.   The computer program product of claim 67, further comprising:

2   a third set of instructions, executable on said computer system, configured to

3   determine said source user group; and

4   a fourth set of instructions, executable on said computer system, configured to

5   determine said destination user group by looking up said destination user

6   group in an access control list.

1   69.   The computer program product of claim 68, wherein said third set of

2   instructions comprises:

3   a first subset of instructions, executable on said computer system, configured to

4   extracting a source user group identifier from said packet, wherein

5   said source user group identifier identifies said source user group.

1   70.   An apparatus comprising:

2   means for populating an access control list with a destination user group identifier,

3   wherein

4   said destination user group identifier identifies a destination user group of

5   a destination.

1   71.   The apparatus of claim 70, further comprising:

2   means for comparing a user group of a packet with said destination user group.

1   72.   The apparatus of claim 71, wherein

2   said user group of said packet is a source user group,

3   said destination user group is a user group of a destination of said packet, and

4   said destination is said destination of said packet.

1   73.   The apparatus of claim 72, further comprising:

2   means for determining said source user group; and

3   means for determining said destination user group by looking up said destination

4   user group in an access control list.

1   74.   The apparatus of claim 73, wherein said means for determining said source

2   user group comprises:

3   means for extracting a source user group identifier from said packet, wherein

4   said source user group identifier identifies said source user group.

1   75.   A method comprising:

2   populating a forwarding table with a user group identifier.

1   76.   The method of claim 75, wherein

2   said user group identifier is a source user group identifier, and so identifies a

3   source user group.

1   77.   The method of claim 76, wherein

2   a source of a packet is in said source user group.

1   78.   The method of claim 77, wherein

2   said source user group is assigned to said source based on a role of said source.

1   79.   The method of claim 77, wherein said populating comprises

2   determining said source user group.

1   80.   The method of claim 79, wherein said populating is performed by a

2   network device and further comprises:

3   receiving an authentication message from another network device, wherein

4   said response includes said source user group identifier.

1   81.   The method of claim 77, wherein

2   a destination of said packet is in a destination user group.

1   82.   The method of claim 81, wherein

2   said destination user group is assigned to said destination based on a role of said

3   destination.

1   83.   The method of claim 81, further comprising:

2   comparing a source user group of said packet with said destination user group.

1   84.   The method of claim 83, wherein

2   said source user group of said packet is indicated by a source user group identifier

3   stored in said packet, and

4   said destination user group is indicated by a destination user group stored in a

5   network device performing said comparison.

1   85.   The method of claim 81, further comprising:

2   determining said source user group; and

3   determining said destination user group by looking up said destination user group

4   in an access control list stored at said network device performing said

5   comparison.

1   86.   The method of claim 85, wherein said determining said source user group

2   comprises:

3   extracting said source user group identifier stored in said packet from said packet,

4   wherein

5   said source user group identifier stored in said packet identifies said source

6   user group of said source of said packet.

1   87.   A computer program product comprising:

2   a first set of instructions, executable on a computer system, configured to populate

3   a forwarding table with a user group identifier, wherein

4   said user group identifier is a source user group identifier, and so identifies

5   a source user group; and

6   computer readable media, wherein said computer program product is encoded in

7   said computer readable media.

1   88.   The computer program product of claim 87, wherein said first set of

2   instructions comprises:

3   a first subset of instructions, executable on said computer system, configured to

4   determine said source user group.

1   89.   The computer program product of claim 88, wherein said first set of

2   instructions comprises:

3   a second subset of instructions, executable on said computer system, configured to

4   receive an authentication message from another network device, wherein

5   said response includes said source user group identifier.

1   90.   The computer program product of claim 87, wherein

2   a destination of said packet is in a destination user group.

1   91.   The computer program product of claim 90, further comprising:

2   a second set of instructions, executable on said computer system, configured to

3   determine said source user group; and

4   a third set of instructions, executable on said computer system, configured to

5   determine said destination user group by looking up said destination user

6   group in an access control list stored at said network device performing

7   said comparison.

1   92.   The computer program product of claim 91, wherein said second set of
2   instructions comprises:
3   a first subset of instructions, executable on said computer system, configured to
4   extracting said source user group identifier stored in said packet from said
5   packet, wherein
6   said source user group identifier stored in said packet identifies said source
7   user group of said source of said packet.

1   93.   An apparatus comprising:
2   means for populating a forwarding table with a user group identifier, wherein
3   said user group identifier is a source user group identifier, and so identifies
4   a source user group.

1   94.   The apparatus of claim 93, wherein said means for populating comprises
2   means for determining said source user group.

1   95.   The apparatus of claim 94, wherein said means for populating is performed
2   by a network device and further comprises:
3   means for receiving an authentication message from another network device,
4   wherein
5   said response includes said source user group identifier.

1   96.   The apparatus of claim 93, wherein
2   a destination of said packet is in a destination user group.

1   97.   The apparatus of claim 94, further comprising:
2   means for determining said source user group; and
3   means for determining said destination user group by looking up said destination
4   user group in an access control list stored at said network device
5   performing said comparison.

1 98. The apparatus of claim 97, wherein said means for determining said source

2 user group comprises:

3   means for extracting said source user group identifier stored in said packet from

4   said packet, wherein

5   said source user group identifier stored in said packet identifies said source

6   user group of said source of said packet.

1 99. A method comprising:

2 indexing a row of a permissions matrix with a first user group; and

3 indexing a column of said permissions matrix with a second user group.

1 100. The method of claim 99, wherein

2 said first user group is a source user group, and

3 said second user group is a destination user group.

1 101. The method of claim 100, wherein said permissions matrix comprises:

2 a plurality of permissions matrix entries.

1 102. The method of claim 101, wherein

2 each of said permissions matrix entries is a pointer to a data structure.

1 103. The method of claim 102, wherein

2 said data structure is a permission list.

1 104. The method of claim 102, wherein

2 said data structure is a permission list entry.

1 105. The method of claim 102, wherein

2 said data structure is a pointer to a permission list.

1 106. The method of claim 105, wherein said data structure further comprises:

2 another pointer to another permission list.

1 107. The method of claim 102, further comprising:

2 employing permission list chaining in said data structure.

1 108. The method of claim 102, further comprising:

2 selecting a selected permissions matrix entry of said permissions matrix entries,

3 wherein said selecting comprises

4 identifying a row of said permissions matrix using a source user group

5 identifier,

6 identifying a column of said permissions matrix using a destination user

7 group identifier, and

8 identifying a permissions matrix entry of said permissions matrix entries in

9 said row and said column as said selected permissions matrix entry.

1 109. The method of claim 108, further comprising:

2 selecting a permission list from a plurality of permission lists using said selected

3 permissions matrix entry.

1 110. The method of claim 108, further comprising:

2 selecting a permission list entry from a permission list using said selected

3 permissions matrix entry.

1 111. A network comprising:

2 a first network device, wherein

3 said first network device is configured to generate a packet, and

4 said packet comprises a source user group identifier.

1 112. The network of claim 111, wherein

2 said source user group identifier identifies a user group of said first network

3 device.

1   113.   The network of claim 111, further comprising:

2   a second network device, wherein

3   said second network device is coupled to receive said packet,

4   said second network device comprises an access control list,

5   said access control list comprises an access control list entry, and

6   said access control list entry comprises a user group field.

1   114.   The network of claim 113, wherein

2   said second network device is configured to compare said source user group

3   identifier with a destination user group of a destination of said packet

4   said destination user group is identified by a destination user group identifier, and

5   said destination user group identifier is stored in said user group field.

1   115.   The network of claim 114, wherein said access control list entry further

2   comprises:

3   a plurality of user group fields, wherein

4   said user group fields further comprise

5   a source user group field, and

6   a destination user group field, and

7   said user group field is said destination user group field.

1   116.   The network of claim 113, further comprising:

2   a third network device, wherein

3   said third network device is coupled between said first and said second

4   network devices,

5   said third network device comprises a forwarding table,

6   said forwarding table comprises a plurality of forwarding table entries, and

7   at least one forwarding table entry of said forwarding table entries

8   comprises a user group field.

1   117. The network device of claim 116, wherein said at least one forwarding

2 table entry further comprises:

3   a port identifier field, wherein

4   a port identifier stored in said port identifier field identifies a port,

5   said packet is received on said port, and

6   a user group, identified by a user group identifier stored in said user group

7   field, is associated with said port.
